ABSTRACT

Two chalcones (4a, 4b) and nine Schiff bases (4c - 4k) of 7-hydroxy-3-formyl chromen-4-one have been synthesized and characterized on the basis of IR, NMR and elemental analysis. All the synthesized compounds were evaluated for antimicrobial activity against both gram positive and gram negative organisms. The Schiff base synthesized from 2,4-dinitro phenyl hydrazine (4h) have shown the significant antimicrobial activity.

Keywords: Chromenone, Chalcones, Schiff base, Antimicrobial.

INTRODUCTION

Oxygen containing heterocycles are abundantly found in nature. Flavone, isoflavones, flavanones, catechins, anthocyanins are some phytoconstituents collectively grouped as flavonoids and isoflavonoids. Chemically they are categorized as chromenes, chromenones, dihydrofurobenzofurans, chromanochromanones, benzofurochromans, xanthones and amphipyrones. Chromenones are naturally occurring compounds possessing diverse biological and pharmacological activities. Many synthetic analogues of chromenones have been evaluated for their anticancer, anticonvulsant, angioprotective, antiallergic, antihistaminic, antimicrobial, antioxidant, anti-HIV. Due to emergence of multi-drug-resistant strains of microbes like methicillin resistant staphylococcus aureus (MRSA), vancomycin resistant enterococci (VRE), multidrug resistant mycobacterium tuberculosis (MDR-TB) and penicillinase producing neisseria gonorrhoeae (PPNG), microbial diseases have become more complex to tackle. Many synthetic and semi-synthetic antimicrobial drugs have been discovered and used in clinical practice. In spite of significant developments in antimicrobial therapy, the problem of drug resistance, spectrum of activity, potency, safety and toxicity remain unresolved. Many quinolones and fluoroquinolones like Norfloxacain, Lomefloxacin, Enoxacin, Ofloxacin, Ciprofloxacain, Levofloxacain, Sparfloxacain, Gatifloxacain, Moxifloxacain, Garenoxacin and Moxifloxacain are used in clinical practice. Structurally 4-quinolones and 4H-chromen-4-ones are very similar in many respects. Calchones and Schiff’s bases of heterocyclic compounds are also versatile molecules possessing antimicrobial activity. Based on above impetus we attempted the synthesis of chalcones and Schiff bases of 4H-chromen-4-ones.

EXPERIMENTAL

Melting points of the synthesized compounds were determined by using Veego melting point apparatus and are uncorrected. The IR spectra of the
synthesized compounds were recorded using KBr pellet method in the range of 4000-500 cm$^{-1}$ on Shimadzu IR-Affinity 1800 Fourier Transform IR Spectrophotometer, and frequencies were recorded in wave numbers. $^1$H NMR (400 MHz) spectra was recorded on Varian Mercury-300 NMR spectrometer using CDCl$_3$. Chemical shifts (δ) are reported in parts per million (ppm) down field from internal reference TMS. Purity of the compounds were checked by thin layer chromatography using silica gel-G coated aluminium plates (Merck, 60F254) as stationary phase, n-hexane : ethyl acetate as mobile phase.

**Preparation of 2,4-dihydroxyacetophenone (Resacetophenone)**

2,4-dihydroxyacetophenone was synthesized by reported method. Briefly, the synthesis was carried out by dissolving freshly fused and powdered zinc chloride (0.24 mole) in 32 ml of glacial acetic acid by heating in sand bath. Dry resorcinol (0.2 mole) was added with stirring at 140°C. The solution was heated until it just begins to boil and kept for 20 minutes at 150°C. Dilute HCl (1:1) was added to the mixture and the solution was cooled to 5°C. The separated product was filtered and washed with dilute HCl. The product was recrystallised from hot water. The physical data of synthesized compounds are given in Table 1.

**Preparation of 7-hydroxy-3-formyl chromen-4-one**

In dry DMF (60 ml) in three neck flask, POCl$_3$ (37.5 ml) was added slowly with vigorous stirring at 50°C. Heating and stirring was continued for 2 hrs at 45-55°C. The solution of resacetophenone (9.12 gm) in DMF (12.5 ml) was then slowly added with stirring at 50°C and stirring was continued for 2 hrs. After cooling the mixture was kept overnight at room temperature and diluted slowly by adding ice cold water (250 ml) and was stirred again for 6hrs. The red crystalline product separated was filtered and recrystallised from alcohol.

**Preparation of Schiff bases (4a – 4k)**

Schiff bases were prepared by reaction of equimoles of 7-Hydroxy-3-formyl chromen-4-one and various amines. 7-Hydroxy-3-formyl chromen-4-one (0.01 mole) was dissolved in 5 ml methanol. Amine (0.01 mole) was added with constant stirring. To the resulting mixture 2-4 drops of concentrated H$_2$SO$_4$ was added and the mixture was refluxed for 1-2 hrs. After completion of reaction mixture was poured over crushed ice with stirring. The product obtained was filtered and recrystallised from methanol.

**Spectral characteristics of synthesized compounds**

4a: FT-IR (KBr pellet, cm$^{-1}$) 3221 (O-H str), 1600 (C=O str), 1640 (C=O str), $^1$H NMR (CDCl$_3$, δ ppm) 6.279 (d, -CH$_2$, 1H), 6.61 (d, Ar-H, 1H), 6.85 (d, Ar-H, 1H), 7.04-7.96 (m, Ar-H, 6H), 7.72 (d, -CH$_2$, 1H), 7.76 (d, -CH$_2$, 1H); Anal Calcd. for C$_{17}$H$_{14}$O$_2$: C (73.97%), H (4.14%), O (21.9%); Found: C (73.87%); H (4.15%); O (21.68%).

4b: FT-IR (KBr pellet, cm$^{-1}$) 3302 (O-H str), 1606 (C=O str), 1701 (C=O str), $^1$H NMR (CDCl$_3$, δ ppm) 5.35 (s, -OH, 3H), 6.38-6.69 (m, Ar-H, 5H), 7.22 (d, -CH$_2$, 1H), 7.76 (d, -CH$_2$, 1H), 7.96 (m, Ar-H, 2H); Anal Calcd. for C$_{19}$H$_{15}$O$_2$: C (66.67%), H (3.73%), O (29.6%); Found: C (65.71%); H (4.15%); N (30.14%).

4c: FT-IR (KBr pellet, cm$^{-1}$) 3446 (O-H str), 1620 (C=O str), 1510 (C=N str) 3309 (N-H str) $^1$H NMR (CDCl$_3$, δ ppm) 5.4 (s, -OH, 1H), 6.45-7.96 (m, Ar-H, 4H), 7.0 (s, -NH, 1H), 8.56 (s, -NH, 2H), 8.83 (s, -NH, 1H); Anal Calcd. for C$_{13}$H$_{11}$N$_2$O$_2$: C (50.18%), H (3.45%), N (15.96%), O (18.23%), S (12.18%); Found: C (51.56%); H (4.15%); N (15.80%); O (18.79%); S (9.7%).

4d: FT-IR (KBr pellet, cm$^{-1}$) 3385 (O-H str), 1625 (C=O str), 1625 (C=O str) 3221 (N-H str) $^1$H NMR (CDCl$_3$, δ ppm) 5.3 (s, -OH, 1H), 6.45-7.96 (m, Ar-H, 4H), 7.0 (s, -NH, 1H), 6.0 (s, -NH, 2H), 8.83 (s, -NH, 1H); Anal Calcd. for C$_{19}$H$_{15}$O$_2$: C (53.44%), H (3.67%), N (17%), O (25.89%); Found: C (53.89%); H (4.10%); N (16.99%); O (25.02%).

4e: FT-IR (KBr pellet, cm$^{-1}$) 3219 (O-H str), 1618 (C=O str), 1610 (C=O str), $^1$H NMR (CDCl$_3$, δ ppm) 5.3 (s, -OH, 1H), 6.45-7.96 (m, Ar-H, 4H), 7.0 (s, -NH, 1H), 6.0 (s, -NH, 2H), 8.83 (s, -CH$_2$, 1H); Anal Calcd. for C$_{19}$H$_{15}$O$_2$: C (58.82%), H (3.95%), N (13.72%), O (23%); Found: C (57.78%); H (4.15%); N (14.10%); O (23.97%).

4f: FT-IR (KBr pellet, cm$^{-1}$) 3400 (O-H str), 1624 (C=O str), 1508 (C=O str), $^1$H NMR (CDCl$_3$, δ ppm) 5.35 (s, -OH, 1H), 6.45-6.69 (m, Ar-H, 2H), 7.0 (s, -NH, 2H), 7.58-7.96 (m, Ar-H, 2H), 6.8 (s, -CH$_2$, 1H), 9.1 (s, -OH, 1H); Anal Calcd. for C$_{19}$H$_{15}$O$_2$: C (58.54%), H (3.44%), N (6.83%), O (25.02%).
Antimicrobial activity

The antimicrobial activity of all the synthesized compounds (4a – 4k) were examined against different Gram-positive (Bacillus subtilis and Staphylococcus aureus) and Gram-negative (Escherichia coli and Pseudomonas aeruginosa) by measuring zone of inhibition. The antimicrobial activity was performed by agar cup plate method at the concentration level of 100µg/ml. Streptomycin was used as standard drug at a concentration of 100µg/ml. Nutrient agar was used as culture media for antibacterial activity. 24 hrs old culture of bacterial pathogen was placed in nutrient agar and spread throughout the plate by spread plate technique. Wells were bored using sterile borer at equidistance. The plates were kept at room temperature for 30 minutes. The test compounds, standard and control was placed in respective wells and plates were incubated at 37°C for 36 hrs. Zone of inhibition was measured by zone reader. The results are given in table 2.

Evaluation of physical properties

Computational study for prediction of ADME properties of the molecules was performed by determination of lipophilicity, TPSA and other simple molecular descriptors. Each structure was fully geometry optimized using the Chem 3D Pro 11.0 by MM2 force field. Various molecular descriptors were then computed by using molinspiration tool and TSAR software. The data is given in Table 1.

RESULT AND DISCUSSION

All the synthesized compounds have been characterized by IR, 1H NMR spectral data and elemental analysis and were evaluated for their antimicrobial activity against Gram positive and Gram negative organisms. Compound 4h showed significant antimicrobial activity against all test organisms. From the physical properties computed it was found that compound 4h has more total polar surface area and higher log P value. Thus TPSA and log P values may be contributing towards the better antimicrobial activity. Compounds 4b, 4g, 4j and 4k showed moderate antimicrobial activity against test organisms. Compounds 4d, 4e and 4i showed poor activity against test organisms. Chalcone 4a was found more effective than 4b and lipophilicity may be the contributing factor in this case. This research work reveals that the chalcones and Schiff bases of chromenone possess antimicrobial activity.

CONCLUSION

The calchone and Schiff base analogues of chromen-4-ones synthesized were found promising antibacterial agents.

ACKNOWLEDGEMENT

I would like to express my gratitude to Prof. M. N. Navale, Founder President, Shinhad Technical Education Society, Pune and Principal, Smt. Kashibai Navale College of Pharmacy, for providing the necessary facilities during the course of this research work.
