#### Abstract

Succinic acid was converted to 1 ( 3 -chlorophenyl)-pyrrolidine-2, 5 -dione $\mathbf{1}$ This cydic imide on condensation with p-hydroxy benzaldehyde in acetic acid furnished 1 (3-chlorophenyl)-3, 4-bis-(4-hydroxy-benzylidene)-pyrrolidine-2,5 dione 2. This pyrrolidine-2, 5-dione undergo cyclisation with hydrazine hydrate, hydroxylamine hydrochloride, semicarbazide, furnish pyrazole, isoxazole, pyrazole acetamideand benzodiazodizepine compound $\mathbf{3}_{\text {a-c }}$ respectively. Similarly the pyrrolidine-2, 5-dione on treatment with substituted aromatic aldehydes, malononitrile in presence of piperidine in ethanol underwent ring closer and furnished azo-flurorene derivatives $\mathbf{4}_{\text {a-d }}$ and with acetaldehyde, malononitrile in presence of piperidine in ethanol pyrrolidine-2, 5-dione afforded azo-flurorene 5.

Keywords Cyclic imide, pyrrolidine-2, 5-dione, pyrazole, isoxazole, pyrazole acetamide, azo-flurorene.

## INTRODUCTION

In recent years the study of the chemistry of imides has been given particular impacts, because of their pharmacological and other industrial uses. For examples, derivatives of imides have proved to be important medicinal agent and have been suggested for use in the treatment of arthritis ${ }^{1}$, tuberculosis ${ }^{2}$, convulsions and epilepsy ${ }^{3}$. A number of imides can be used to stimulate the growth of plants and seedlings during the early stage of germination. For examples 2, 4-dichlorophenyl succinimide stimulates the growth of wheat and radish seedlings ${ }^{4}$. Conversely other imide derivatives have been used as fungicides and as herbicides ${ }^{5}$. The surface active properties of some imides assist their insecticidal and fungicidal properties. Aromatic imides are used successfully as brightening agent in the laundry and allied industries ${ }^{6}$.
In the recent years, attention has been increasingly paid to the synthesis of bis-heterocyclic compounds which exhibit various biological activity ${ }^{7-10}$.

## RESULT AND DISCUSSION

1-(3-chlorophenyl)-pyrrolidine-2,5 dione 1, required for the synthesis of title compound was prepared from succinyl chloride by heating a mixture of succinic acid and thionyl chloride followed by conversion of the intermediate succinyl chloride to the title compound by refluxing with m -chloro aniline in presence of benzene ${ }^{\text {I1 }}$. I.R. Spectra of this compound showed
doublet at around 1711 and $1680 \mathrm{~cm}^{-1}$ indicating the presence of cyclic imide. The PMR $\left(\mathrm{CDCl}_{3}\right)$ spectrum showed the characteristic slitting pattern of four succinimide proton as a singlet around $\delta$ 2.77. The other precursor 1-(3-chlorophenyl)-3, 4-bis-(4-hydroxy-benzylidene)-pyrrolidine-2,5 dione 2 was prepared by condensation of cyclic imides 1 with p-hydroxy benzaldehyde in acetic acid as shown in Scheme-I. the title compounds were then prepared by condensation of 1-(3-chlorophenyl)-3, 4-bis-(4-hydroxy-benzylidene)-pyrrolidine-2,5
dione with hydrazine hydrate, hydroxylamine hydrochloride, semicarbazide in ethanol in presence of piperidine Scheme-II.
On the other hand the 1-(3-chlorophenyl)-pyrrolidine-2, 5-dione on treatment with substituted aromatic aldehyde, malononitrile in presence of piperidine in ethanol underwent ring closure furnished azo-flurorene $\mathbf{4}_{\text {a-d }}$ Scheme-III. Similarly with acetaldehyde, malononitrile in presence of piperidine in ethanol 2, 5-dione afforded azoflurorene 5 Scheme-IV.

## Experimental Section

All the melting points were determined by open capillary method and are uncorrected. The purity of compound was monitored by TLC on silica gel coating aluminium plate using U.V. light as visualizing agent. The I.R. spectra ( KBr in $\mathrm{cm}^{-1}$ ) were recorded on Perkin-Elmer Spectrophotometer in the range of $4000-400 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR

Spectra were recorded on Varion 500 MHz NMR Spectrophotometer using DMSO-d6 as a solvent and TMS as an internal standard (chemical shift in $\delta \mathrm{ppm}) . \mathrm{C}, \mathrm{H}, \mathrm{N}$ determinations were run on CarloErba 1108 (CHNS) Elemental analyzer.
